SUBJ: ALLEYWAY INVESTIGATION

Based on review of all of the Initial Phase III Sample Program data and visual inspection of alleys throughout the Study Area, no unpaved alleyways exist adjacent to properties with an average arsenic concentration exceeding 200 ppm. Alleyway composition adjacent to these properties includes concrete, asphalt, and broken concrete or asphalt with some exposed soil. In the entire study area only ten unpaved alley ways have been observed. Therefore, the alley investigation is considered completed for the Initial Phase III Sampling Program.
